Visure Requirements 4.8 is Available Now!!

This new release includes features for improved usability, functionality and performance.

San Francisco, Feb 9, 2015 – Visure Solutions, the market leader in Requirements Lifecycle Management, is pleased to announce the release of Visure Requirements 4.8. This new version includes features for improved usability, functionality and performance.

Users can now create and edit information in Visure Requirements faster, reducing the number of interactions with the tool for several tasks; at the same time, those interactions have also become more user-friendly, so that users can now be more productive in one of the main activity areas in the tool. Users can more easily create links, through the new drag & drop link creation functionality.

They can search for text in items faster and replace with new text, through the new Search and Replace tool. Also, with a redesigned multi-item attribute edit tool, users can more easily modify attribute values for a selection of items, which can help in activities such as establishing initial values for selection of items, or reconfiguring attribute values after copying information.

Information browsing and analysis have also become much easier and faster with Visure Requirements 4.8. View creation and editing has been reviewed, so that the functionality is now more at hand, with the new column title context menu and the new configuration dialogs. As a result, users can now create or modify views faster, increasing the value of the functionality that can now be used even for small tasks. View creation and modification is now more evident to all users, not just tool specialists.

Visure Requirements 4.8 greatly helps users perform traceability analysis, increasing the number of questions that can be answered with the tool. Through the improved links filter capabilities, users can now more easily respond to questions such as "Which of my requirements are not currently linked to tests" or "which of my requirements are gold plating, since they are not traced to higher level requirements". The new filter capabilities enable users to very easily obtain a list of items that have or don't have a specific type of link associated.

Finally, Visure Solutions in its continued effort to improve tool performance, has put in Visure Requirements 4.8 special attention to this aspect in low bandwidth environments, where performance has been increased by up to 50% in some functionalities in these environments. This performance increase may also benefit users in other network environments, who should perceive noticeable increases in user responsiveness in some areas, like project opening.

Visure Solutions continues to listen to users and to work on improvements in the tool suite, in order to provide best in class solutions for requirements management needs from companies around the globe.

Baldo Rincón, our COO says *"With this new release, Visure Requirements users can perform requirements management activities easier, quicker and simpler so that their organizations are capable to accomplish their projects more efficiently"*
